ART UNIT 2883		PAPER NUMBER		
NOTIFICATION DATE 05/12/2010		DELIVERY MODE ELECTRONIC		

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

mailroom@bskb.com

Office Action Summary

Application No.

10/814,141

Applicant(s)

CHO ET AL.

Examiner

ANDREW SCHECHTER

Art Unit

2883

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 01 February 2010.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1, 15 and 24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1, 15 and 24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 01 April 2004 is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB-06)
Paper No(s)/Mail Date _____

- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Response to Arguments

1. Applicant's arguments filed 1 February 2010 have been fully considered but they are not persuasive. Applicant's arguments have been considered but are moot in view of the new ground(s) of rejection.

The applicant [pp. 8-10] recites a body of claim limitations and argues generally that the prior art references do not disclose or teach them in some way. This is not persuasive. It appears to the examiner that the prior art discloses and/or teaches the claimed invention as discussed below; the previous rejections are maintained, modified as necessary due to the amendments to the claims.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claim 24 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The amended claim recites forming a passivation layer over the source and drain electrodes "by a roller printing process". This does not appear to be disclosed by the application as originally filed. Instead, the application discloses forming the contact hole photoresist pattern (recited in the next line) by a roller printing process, as claimed in claim 1. The examiner assumes that this was the intent of the applicant for claim 24 as well.

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

5. Claim 24 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The amended claim recites forming a passivation layer over the source and drain electrodes "by a roller printing process". This does not appear to be disclosed by the application as originally filed. Instead, the application discloses forming the contact hole photoresist pattern (recited in the next line) by a roller printing process, as claimed in claim 1. The scope of the claim is therefore unclear; the examiner assumes that it was intended to recite the contact hole photoresist pattern being formed by a roller printing process, rather than the passivation layer being formed in such a manner.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 1, 15, and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Deane et al.*, U.S. Patent No. 6,686,229 in view of official notice / admitted prior art, in view of *Chae* US 2002/0135710, and further in view of *Okazaki et al.*, U.S. Patent No. 5,127,330.

Deane discloses [see Fig. 1, for instance] a fabrication method of a liquid crystal display device, comprising: providing a substrate [1], forming a gate line [5] on a substrate by forming metal layer [3] on the substrate, forming a gate photoresist pattern on the metal layer by a first printing process and etching the metal layer using the gate photoresist pattern as a mask to form a gate line [col. 7, lines 60-67], removing the gate photoresist pattern [an inherent or implicitly-understood part of the process]; sequentially forming a gate insulating layer [13], a semiconductor layer [17], and a high-concentrated N⁺ layer [19] over the substrate and the gate line; forming an active photoresist pattern on the high-concentrated N⁺ layer by a second printing process [col. 7, lines 60-67]; forming an active region including the high-concentrated N⁺ layer by applying an active photoresist pattern by the second printing process [col. 7, lines 60-67], wherein the active region is formed by sequentially etching the high-concentrated N⁺ layer and the semiconductor layer using the active photoresist pattern formed by the

second printing process as a mask [see Fig. 1b] to form a semiconductor layer pattern and a high-concentrated N+ layer pattern, wherein the active region comprises the semiconductor layer pattern and the high-concentrated N+ layer pattern; removing the active resist pattern [an inherent or implicitly-understood part of the process]; forming a conductive layer [23] over the active region and the gate insulating layer; forming a source/drain electrode [29, 27]; forming a passivation layer [33] over the substrate and the source and drain electrodes; forming a contact hole photoresist pattern over the passivation layer by a third printing process [col. 6, lines 17-22]; removing the passivation layer by using the contact hole photoresist pattern as a mask to form a contact hole [35] exposing the drain electrode; removing the contact hole photoresist pattern [an inherent or implicitly-understood part of the process]; forming a pixel electrode layer over the passivation layer and the contact hole; forming a pixel electrode photoresist pattern by a fourth printing process [col. 7, lines 60-67], and removing the pixel electrode layer by using the pixel electrode photoresist pattern as a mask to form a pixel electrode [37] electrically connected with the drain electrode.

For the steps of forming the gate line, forming the semiconductor layer and N+ layer, and forming the pixel electrode, the reference describes directly printing the layers onto the substrate [as can be seen from the "tails" shown in the figures, for instance]. However, the reference also explicitly states [col. 7, lines 60-67] that these printing processes can be replaced with the process of covering the substrate with the material of the layer, printing a photoresist pattern onto the material, and etching to pattern the layer. The reference also provides motivation to do so, in that it avoids the

need to use conventional photolithography to process the photoresists, thus lowering costs while not needing to directly print the layer. The examiner has therefore treated the relevant claim limitations as explicitly disclosed by the reference, as noted above; alternatively, they could be considered as not disclosed by the particular embodiment of Fig. 1 (and initial discussion thereof), but obvious to one of ordinary skill in the art at the time of the invention due to these teachings of *Deane* [col. 7, lines 60-67]. In either case, these claim limitations are met by *Deane*.

Deane does not explicitly disclose depositing a photoresist layer over the conductive layer, applying a mask over the photoresist layer, and performing a lithography process, to thereby form the source and drain electrodes. Instead, *Deane* merely states that the conductive layer is "then patterned using conventional photolithography" [col. 5, lines 35-36]. The examiner took official notice that it was well-known in the art for conventional photolithography to include steps of depositing a photoresist layer over a conductive layer, applying a mask over the photoresist layer, and performing a lithography process to form a photoresist layer pattern [this taking of official notice was not traversed by the applicant, therefore the statement is considered admitted prior art, see MPEP 2144.04]. It would have been obvious to one of ordinary skill in the art at the time of the invention to have these steps in the method of *Deane*, motivated by the desire to use conventional photolithographic techniques, having high reliability and precision, to form the source and drain electrodes.

Deane does not disclose sequentially removing the conductive layer and the high-concentrated N⁺ layer pattern above the channel region by using the photoresist

layer pattern as a mask to form a source and drain electrodes. Instead, the photoresist layer pattern is used as a mask to remove the conductive layer to form a source and drain electrodes and the photoresist layer pattern is then removed; the source and drain electrodes themselves (instead of the identically shaped photoresist layer pattern) are then used as the mask to remove the high-concentrated layer above the channel region.

Chae discloses [see Fig. 6C, paragraph 0061, for instance] a method of forming an analogous TFT, in which the source and drain electrodes [35, 37] are formed, the photoresist is removed, and the source and drain electrodes are then used as the mask to remove the high-concentrated layer [47], just as in *Deane*. *Chae* then goes on to say [paragraph 0062] that alternatively the photoresist can be left in place and used as the mask in removing the high-concentrated layer, just as in the present application. This is evidence that the two sequences are considered art-recognized equivalents. It would have been obvious to one of ordinary skill in the art at the time of the invention to use the photoresist as the mask for removing the high-concentrated N⁺ layer pattern, motivated by the art-recognized equivalence of the two methods. (Also, as above, removing this photoresist layer pattern after it has served its purpose is an inherent or implicitly-understood part of the process.)

Regarding the additional limitations that the first to fourth printing processes are roller printing processes, the examiner previously took official notice that roller printing was known in the art, and as this was not traversed by the applicant, this was taken as admitted prior art [see MPEP 2144.04]; the use of roller printing was held to have been obvious to one of ordinary skill in the art at the time of the invention in this case in

Deane, motivated by its being a reliable, cost-effective technique for printing. This remains valid. However, the taking of official notice did not extend to the newly recited details of the roller process, namely that each of the first to fourth roller printing processes include: providing a cliché having an intaglio pattern of a groove form; depositing a predetermined amount of photoresist on the cliché; rotating a roller on the cliché to transfer the photoresist contained in the cliché onto a surface of the roller; and rotating the roller on the substrate to re-transfer the photoresist contained in the roller onto the substrate thereby forming a photoresist pattern on the substrate.

Okazaki et al. discloses [see Figs. 8-9, for instance, and discussion thereof] an analogous method in which roller printing is used to pattern a resist onto a surface in order to etch a layer [7]. The process includes providing a cliché [1] having an intaglio pattern of a groove form; depositing a predetermined amount of photoresist [3] on the cliché; rotating a roller [9] on the cliché to transfer the photoresist contained in the cliché onto a surface of the roller [Fig. 8b]; and rotating the roller on the substrate to re-transfer the photoresist contained in the roller onto the substrate [Fig. 8c] thereby forming a photoresist pattern on the substrate. It would have been obvious to one of ordinary skill in the art at the time of the invention to use such a roller printing process in the above device, motivated by it being a conventional roller printing technique which is well-understood and would not require unnecessary experimentation, for instance.

Claim 1 is therefore unpatentable.

Since the other steps are done by printing rather than conventional photolithography, the mask applied over the photoresist layer in the step of applying the

mask is the only mask applied throughout the method of the independent claim, so claim 15 is also unpatentable.

Considering claim 24, the method discussed above meets all its recited limitations, except for the data line and storage electrode which are not recited in claim 1. *Deane* discloses these formed of the same metal layer as the source/drain electrodes, so when the source/drain electrodes are formed, a data line [25] and a storage electrode [35] are simultaneously formed by the mask process. To the extent that the applicant might actually intend for the passivation layer to be formed by roller printing (as opposed to being spun-on, vapor deposited, etc.), the examiner takes official notice that it is known in the art to apply such passivation layers by roller printing; it would have been obvious to one of ordinary skill in the art to do so here, motivated by it being a conventional technique. Claim 24 is therefore also unpatentable.

Conclusion

8. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the

shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Andrew Schechter whose telephone number is (571) 272-2302. The examiner can normally be reached on Monday - Friday, 9:00 - 5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark Robinson can be reached on (571) 272-2319. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
